

Testing of pressure equipment

Green light for your systems – and a safer working environment.

Whether pressure vessels or pipelines: Pressure equipment involves risks for people and the environment and is therefore subject to strict regulations. Pressure vessel tests are mandatory and ensure efficiency and safety in the workplace. As a plant operator, you are responsible for compliance with all regulations for your jurisdiction.

Testing of pressure equipment

Pressure equipment must be checked before commissioning and regularly during the operating phase.

The provisions apply not only to the individual components of the pressure system installation but also to the installation as a whole.

You are legally obliged to comply with all audit deadlines that apply to your country.

We offer

Comprehensive, reliable and flexible execution by a competent person

Organization / execution of prescribed tests

Conformity with the operational safety regulations and thus a lower risk for you as the operator

Pressure system requiring monitoring (exemplary illustration)

¹⁾ Note: In this example, the pipelines and the compressor are to be classified as work equipment. The operator/employer must define and arrange for the necessary tests to be carried out as part of a risk assessment.
